

1. CONSTRUCTING QUATERNION AND DIHEDRAL EXTENSIONS BY CLASS FIELD THEORY.

This problem has to do with constructing degree 8 quaternion and dihedral extensions using class field theory.

1. Suppose H is a subgroup of finite index in a group G . The transfer homomorphism

$$\text{Ver}_G^H : G^{ab} \rightarrow H^{ab}$$

between the maximal abelian quotients of G and H is defined in the following way. Let T be a set of representatives for the right cosets of H in G , so that $H \backslash G = \{Ht : t \in T\}$. If $g \in G$ and $t \in T$, then $tg = h_{g,t}t'$ for some $t' \in T$ and $h_{g,t} \in H$. Define

$$\text{Ver}_G^H(\bar{g}) = \bar{h} \quad \text{when} \quad h = \prod_{t \in T} h_{g,t}$$

where \bar{g} (resp. \bar{h}) is the image of g in G^{ab} (resp. the image of h in H^{ab}). Show that if H is cyclic of order 8 and G is a dihedral (resp. quaternion) group of order 8, then Ver_G^H is trivial if G is dihedral, and otherwise Ver_G^H is the unique non-trivial homomorphism which has kernel the image of H in G^{ab} .

2. Let L/K be a finite extension of global fields. Define $C_K = J_K/K^*$ to be the idele class group of K . Let K^{ab} be the maximal abelian extension of K in some algebraic closure containing L . Two basic properties of the Artin map $\Psi_K : C_K \rightarrow \text{Gal}(K^{ab}/K)$ are that the two following two diagrams commute:

$$(1.1) \quad \begin{array}{ccc} C_L & \xrightarrow{\Psi_L} & \text{Gal}(L^{ab}/L) \\ \text{Norm}_{L/K} \downarrow & & \downarrow \text{res}_{L^{ab}/K^{ab}} \\ C_K & \xrightarrow{\Psi_K} & \text{Gal}(K^{ab}/K) \end{array}$$

$$(1.2) \quad \begin{array}{ccc} C_K & \xrightarrow{\Psi_K} & \text{Gal}(K^{ab}/K) \\ i_{K/L} \downarrow & & \downarrow \text{Ver}_{L/K} \\ C_L & \xrightarrow{\Psi_L} & \text{Gal}(L^{ab}/L) \end{array}$$

in which $\text{res}_{L^{ab}/K^{ab}}$ is induced by restriction, $i_{K/L}$ is induced by the inclusion of K into L and $\text{Ver}_{L/K}$ is the transfer map.

Use this to show that all dihedral and quaternion extensions of K arise from the following construction. Let L/K be a quadratic separable extension, and let $\epsilon_L : C_K \rightarrow \{\pm 1\}$ be the unique surjective homomorphism corresponding to L via class field theory. Write $\text{Gal}(L/K) = \{e, \sigma\}$, with σ of order 2. Let $\mu_4 = \{\pm 1, \pm \sqrt{-1}\}$ be the group of fourth roots of unity in \mathbb{C}^* . A surjective homomorphism $\chi : C_L \rightarrow \mu_4$ is of dihedral (resp. quaternion) type if:

- a. $\chi^\sigma = \chi^{-1}$ when $\chi^\sigma : C_L \rightarrow \mu_4$ is defined by $\chi^\sigma(j) = \chi(\sigma(j))$ for $j \in C_L$

- b. The restriction $\chi|_{C_K}$ of χ to C_K via the map $C_K \rightarrow C_L$ induced by including K into L is trivial (in the dihedral case) or the character ϵ_L (in the quaternion case).

Let N be the extension of L which corresponds to the kernel of χ via class field theory over L . Show that N/K is a dihedral (resp. quaternion) extension of degree 8 if χ is of dihedral (resp. quaternion) type, and that all such extensions arise from this construction as L ranges over the quadratic Galois extensions of K . Which pairs (L, χ) give rise to the same N ?

3. The character $\chi : C_L = J_L/L^* \rightarrow \mu_4$ then has local components $\chi_v : L_v^* \rightarrow \mu_4$ for each place v of L defined by $\chi_v(j_v) = \chi(\iota_v(j_v))$ when $\iota_v : L_v^* \rightarrow C_L$ results from the inclusion of L_v into J_L at the place v followed by the projection $J_L \rightarrow C_L/L^*$.
- a. Suppose K is a number field and that K and L have class number 1. Show that there are exact sequences

$$(1.3) \quad 1 \rightarrow O_L^* \rightarrow \prod_v O_v^* \rightarrow C_L \rightarrow 1 \quad \text{and} \quad 1 \rightarrow O_K^* \rightarrow \prod_w O_w^* \rightarrow C_K \rightarrow 1$$

where v and w range over all places of L and K , respectively, including the archimedean places. Conclude from this that to specify a finite order continuous homomorphism

$\chi : C_L \rightarrow \mathbb{C}^*$ it is necessary and sufficient to specify continuous local characters $\chi_v : O_v^* \rightarrow \mathbb{C}^*$ which are trivial for almost all v such that $\prod_v \chi_v$ vanishes on O_L^* .

- b. With the notations of problem (3a), what conditions on the restrictions χ_v are equivalent to χ being of dihedral or quaternion type? (Note that by the same reasoning, the character $\epsilon : C_K \rightarrow \{\pm 1\}$ is determined by its restrictions to the multiplicative groups O_w^* of all places w of K , and that each such O_w^* embeds naturally into the product of the O_v^* associated to v over w in L .)
- c. Suppose $K = \mathbb{Q}$ and $L = \mathbb{Q}(\sqrt{5})$. Show that there is a quaternion character $\chi : C_L \rightarrow \mu_4$ such that the $\chi_v = \chi_v|_{O_v^*}$ have the following properties. The character χ_v is trivial unless v is the unique place v_5 over 5 or one of the two first degree places v_{41} and v'_{41} over 41. The order of χ_v is 2 if $v = v_5$ and 4 if $v = v_{41}$ or $v = v'_{41}$. Finally, when we use the natural inclusion $K = \mathbb{Q} \rightarrow L$ to identify both $O_{v_{41}}$ and $O_{v'_{41}}$ with \mathbb{Z}_{41} , the characters $\chi_{v_{41}}$ and $\chi_{v'_{41}}$ are inverses of each other when we view them both as characters of \mathbb{Z}_{41}^* .

Need to add condition that

if v real then $\chi_v : \mathbb{R}^* \rightarrow \mathbb{C}^*$ is of order 1 or 2,

if v complex then $\chi_v : \mathbb{C}^* \rightarrow \mathbb{C}^*$ is trivial.

Either that, or delete the "finite order" condition.

1. Computation.

①

$$\boxed{G = D_8}$$

$$G = \{1, r, r^2, r^3, s, sr, sr^2, sr^3\}$$

$$G^{ab} = \{1, \bar{r}, \bar{s}, \bar{sr}\} = \mathbb{Z}/2 \times \mathbb{Z}/2$$

$$H = \{1, r, r^2, r^3\}$$

$$T = \{1, s\}$$

$$H \backslash G = \{H, Hs\}$$

$$1 \cdot 1 = 1 \cdot 1$$

$$s \cdot 1 = 1 \cdot s$$

$$1 \cdot r = r \cdot 1$$

$$s \cdot r = r^{-1} \cdot s$$

$$1 \cdot s = 1 \cdot s$$

$$s \cdot s = 1 \cdot s$$

$$1 \cdot sr = r^{-1} \cdot s$$

$$s \cdot sr = r \cdot 1$$

$\Rightarrow \text{Ver}_G^H$ is trivial.

$$\boxed{G = Q_8}$$

$$G = \{\pm 1, \pm i, \pm j, \pm k\}$$

$$G^{ab} = \{1, \bar{i}, \bar{j}, \bar{k}\} = \mathbb{Z}/2 \times \mathbb{Z}/2$$

$$H = \{\pm 1, \pm i\} \quad (\text{the other choices are symmetrical})$$

$$T = \{1, j\}$$

$$H \backslash G = \{H, H_j\}$$

$$1 \cdot 1 = 1 \cdot 1$$

$$j \cdot 1 = 1 \cdot j$$

$$1 \cdot i = i \cdot 1$$

$$j \cdot i = -i \cdot j$$

$$1 \cdot j = 1 \cdot j$$

$$j \cdot j = -1 \cdot 1$$

$$1 \cdot k = i \cdot j$$

$$j \cdot k = i \cdot 1$$

$\Rightarrow \text{Ver}_G^H$ is nontrivial with image $\{\pm 1\}$ and kernel $\text{im}(H \xrightarrow{\text{Ver}_G^H} G^{ab})$.

(2)

2. Let $x: C_L \rightarrow M_4$ be as in the problem. We know that N/k is a degree 8 extension. If one can show that $\text{Gal}(L/k)$ acts nontrivially on $\text{Gal}(N/L)$, then the classification of groups of order 8 will imply that N/k is either of dihedral or quaternionic type.

Note that, by definition of the σ -action on C_L ($\sigma(x_v)_i = (\sigma x_{\sigma v})_i$) one has a commutative diagram

$$\begin{array}{ccccc}
 C_L & \longrightarrow & C_L / \ker x & \xrightarrow[\cong]{\text{Art}_L} & \text{Gal}(N/L) \\
 \sigma \downarrow & & & & \downarrow \sigma(-)\sigma^{-1} \\
 C_L & \longrightarrow & C_L / \ker x & \xrightarrow[\cong]{\text{Art}_L} & \text{Gal}(N/L) \\
 \downarrow x & \nearrow \cong & & & \\
 M_4 & & & &
 \end{array}$$

(condition a) x^{-1}

Since $x \neq x^i$, this means $\text{Gal}(L/k)$ acts nontrivially on $\text{Gal}(N/L)$, as desired.

Accordingly, $\text{Gal}(N^{ab}/k) \cong \mathbb{Z}/2 \times \mathbb{Z}/2$ by problem 1. Let us now consider

$$\begin{array}{ccccc}
 C_k & \longrightarrow & C_k / N_{N/k}(C_N) & \xrightarrow[\cong]{\text{Art}_k} & \text{Gal}(N^{ab}/k) \\
 \downarrow & & & & \downarrow \text{Ver}_{L/k} \\
 C_L & \longrightarrow & C_L / \ker x & \xrightarrow[\cong]{\text{Art}_L} & \text{Gal}(N/L) \\
 \downarrow & \nearrow \cong & & & \\
 M_4 & & & &
 \end{array}$$

We now use condition b.

③

↳ If X is of dihedral type, then the leftmost composition is trivial, implying $\text{Ver}_{L/K}$ is trivial and L/K is dihedral by problem 1.

↳ Similarly if X is of quaternionic type then L/K is quaternionic.

Conversely suppose we are given N/K of dihedral or quaternionic type of degree 8. Then one simply let L/K be any quadratic extension in N , and consider $\chi: G_L \rightarrow G_L/N_{N/L}(G_N) \cong \mu_4$ (which satisfies conditions a and b).

Now suppose (L, χ) and (L', χ') give rise to the same N .

↳ If N/K is dihedral, then there is only one subgroup of order 4, so necessarily $L=L'$. We then need $\ker \chi = \ker \chi'$ to induce the same N by the existence theorem.

↳ If N/K is quaternionic, we have two cases. If $L=L'$ then one again require $\ker \chi = \ker \chi'$. Now suppose $L \neq L'$. Then LL' is of degree 4 over K , and $\text{Gal}(N/LL')$ corresponds to the unique subgroup $\{\pm 1\}$ of Q_8 of order 2. Since $\text{Gal}(N/LL')$ is of index two in both $\text{Gal}(N/L)$ and $\text{Gal}(N/L')$, the requirement is that $\ker \chi$ and $\ker \chi'$ contains a common index two subgroup (after letting L and L' be contained in the same algebraic closure).

3. (a) As L and K has class number 1,

(4)

$$1 = \text{cl}(L) = A_L^x / L^x \prod_v Q_v^x \Rightarrow A_L^x = L^x \prod_v Q_v^x.$$

Thus by isomorphism theorems

$$C_L = A_L^x / L^x = \prod_v Q_v^x / L^x \cap \prod_v Q_v^x = \prod_v Q_v^x / O_L^x.$$

Therefore there is an exact sequence

$$1 \rightarrow O_L^x \rightarrow \prod_v Q_v^x \rightarrow C_L \rightarrow 1.$$

If we have local continuous homomorphisms $\chi'_v: O_v^x \rightarrow \mathbb{C}^x$ with almost all χ'_v trivial and $\prod_v \chi'_v$ vanishing on O_L^x , then we get a homomorphism

$\chi: C_L \rightarrow \mathbb{C}^x$ that is still continuous by the topology of A_L^x . Conversely,

given $\chi: C_L \rightarrow \mathbb{C}^x$ a continuous homomorphism, one gets $\chi'_v: O_v^x \rightarrow \mathbb{C}^x$

with $\prod_v \chi'_v$ vanishing on O_L^x (by above, as L has class number one).

Almost all of the χ'_v are trivial: by picking a neighborhood U of \mathbb{C}^x

containing $\{1\}$ as its unique subgroup, and considering an open subset

$\prod_{i \in I, \text{ finite}} U_i; \prod_{i \in I, \text{ infinite}} O_v^x$ of $\prod_v Q_v^x$ containing the identity, one sees that the

group $\prod_{i \in I} \{1\} \prod_{i \in I} O_v^x$ must map to $\{1\}$ under χ .

Let us also show that χ is of finite order iff $\chi|_{(C_L)_1}$ is trivial, where

$(\mathbb{C}_L)_1$ is the neutral component of L . The 'only if' direction is clear. (5)

Now suppose $\chi|_{(\mathbb{C}_L)_1}$ is trivial. Then by class field theory, and the fact that χ factors through $(\mathbb{C}_L)_1$, one has

$$\begin{array}{ccc} \mathbb{C}_L/(\mathbb{C}_L)_1 & \xrightarrow{\chi} & \mathbb{C}^\times \\ \text{Art} \searrow \eta & & \nearrow \eta \\ & \text{Gal}(L^{\text{ab}}/L) & \end{array}$$

Just as before, as \mathbb{C}^\times has no small subgroups, η is trivial on some $\text{Gal}(L^{\text{ab}}/H)$, with H/L finite (abelian) Galois. Hence η factors through a finite index subgroup, implying χ is of finite order. \square

(b) **Dihedral case** We require $(\chi'_v)^\sigma = (\chi'_v)^{-1}$, and, for w a place of K ,

$$\chi'_w : \mathcal{O}_w^\times \hookrightarrow \prod_{v|w} \mathcal{O}_v^\times \xrightarrow{\chi} \mathbb{C}^\times \quad (\text{and } \prod_{v|w} \chi_v|_{\mathcal{O}_v^\times} = 1)$$

is trivial for all w . Also, almost all $\mathcal{O}_v^\times \xrightarrow{\chi'_v} \mathbb{C}^\times$ need to be trivial, with the nontrivial ones of order dividing 4, and at least one of order 4.

Quaternion case We require $(\chi'_v)^\sigma = (\chi'_v)^{-1}$, and almost all χ'_v trivial with the nontrivial ones of order dividing 4, and at least one of order 4. (and $\prod_{v|w} \chi'_v|_{\mathcal{O}_v^\times} = 1$)

The condition on χ'_w for w a place of K is as follow :

\hookrightarrow if w is unramified in L then χ'_w is trivial,

\hookrightarrow if w is ramified in L then χ'_w has order two.

These conditions follow from local class field theory.

(c) L/K is ramified only at the prime 5. Since we want χ'_v to ⑥
be trivial at all archimedean places, the condition $\prod \chi'_v|_{\mathbb{Q}_2^\times} = 1$ can
be ignored (as χ factors through the finite ideles, and $L^\times \cap \left(\prod_{v \neq \infty} \mathcal{O}_v^\times \cdot (\text{neutral component}) \right) = \{1\}$).

For the finite places, define

$$\chi'_v = \begin{cases} \text{trivial} & \text{if } v \nmid 5 \text{ and } v \nmid 41 \\ \mathcal{O}_v^\times \cong \mu_4 \times (1 + \mathfrak{p}) \rightarrow \mathbb{C}^\times, (\zeta_4, -) \mapsto -1 & \text{if } v = V_5 \\ \mathcal{O}_v^\times \cong \mu_{40} \times (1 + \mathfrak{p}') \rightarrow \mathbb{C}^\times, (\zeta_{40}, -) \mapsto \zeta_4^\pm & \text{if } v = V_{41} \text{ or } V'_{41} \end{cases}$$

This certainly satisfies $(\chi'_v)^\sigma = (\chi'_v)^{-1}$ and $\chi = \prod_v \chi'_v$ of order 4. We
just need to check that its restriction to K agrees with

$$\begin{aligned} \Sigma_k: C_k \cong \prod \mathbb{Z}_p^\times \times \mathbb{R}_{>0}^\times &\rightarrow \mathbb{Z}_5^\times \rightarrow \{\pm 1\} \\ u &\mapsto \left(\frac{u \bmod 5}{5} \right) \end{aligned}$$

But this is clear, for

$$\chi_{41}: \mathbb{Z}_{41}^\times \hookrightarrow \mathcal{O}_{V_{41}}^\times \times \mathcal{O}_{V'_{41}}^\times \rightarrow \mathbb{C}^\times \text{ is trivial}$$

$$\chi_5: \mathbb{Z}_5^\times \hookrightarrow \mathcal{O}_{V_5}^\times \rightarrow \mathbb{C}^\times \text{ agrees with the Legendre symbol } \Sigma_k$$

$$\chi_p: \mathbb{Z}_p^\times \hookrightarrow \prod_{v|p} \mathcal{O}_v^\times \rightarrow \mathbb{C}^\times \text{ is certainly trivial for } p \nmid 5, 41.$$
